

Copper Fittings Manufacturer

Customer's Industry and Application Details:

The customer is a manufacturer of copper fittings.

Due to the nature of the fittings and the production rate that was required, a standard inline pass through machine would not work for this application. Floor space was at a minimum for the customer.

JRI was presented with the task of finding a washer that could wash a large number of small parts in a very small footprint.

The customer wanted to eliminate the need for an operator to wash the parts from the cutting machine.

The JRI Solution:

JRI designed a miniature version of their auger to fit the customer's needs. With floor space being at a minimum, JRI designed an auger that could fit in a footprint of less than four feet long!

This was just what the customer was looking for. They got clean parts with a machine that took up little floor space. The machine was designed to drop the parts directly from the cutting machine into the JRI loading hopper.

In doing so, the operator was able to be productive and increase the productivity of the line by performing other tasks rather than maintaining the washing process. This particular customer has several lines currently in place.
