# A Time For Cleaning

JRI Industries Newsletter

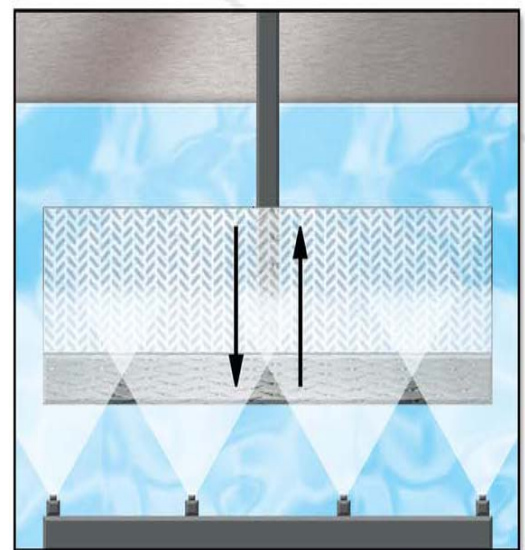

### **JRI DAT Systems**

The key to the JRI Dip Tank Agitation Systems is the effective use of a lift mechanism within each processing chamber. The lift mechanism is used to transport the work into and out of the chamber, but its most important function is to *continuously move* the work within the processing chamber. This ensures a perfectly clean part for every need.

### **Spray Under Immersion Option**

Spray Under Immersion is only one of the options offered on JRI Industry's Dip Agitation Tank Systems. This option allows the machine to wash parts in two different ways. Firstly soaking and agitating to rid the part of any excess dirt or grime. Secondly, the spray under immersion comes into play. This ensures that any left-over dirt or grime gets sprayed off the parts being cleaned.

Spray Under Immersion and Agitation
